

Pegasus Protects

Start Secure. Stay Secure.

The security of your account begins at login. Strengthening your credentials and enabling additional layers of protection helps safeguard your information from unauthorized access.

Why Account Security Matters

Your login credentials are the first line of defense against fraud. Weak or reused passwords make it easier for fraudsters to gain access.

STRENGTHEN YOUR PASSWORDS

1

Make them long

Passwords should be at least 16 characters.

2

Make them random

Making passwords more complex increases the difficulty of attacks that rely on brute force or educated guessing.

Use a random string of mixed-case letters, numbers and symbols. For example:

m@nBrT&7*8aa60\$D

Don't use personal names, dates, repeated characters, or sequences.

pegasusbank1

3

Make them unique

Use a different strong password for each account.

For example:

Bank: k8dfh8c@Pfv0gB2

Social media account: e246gs%mFs#3tv6

Multifactor Authentication

Multi-factor authentication (MFA) adds an extra layer of protection by verifying your identity in more than one way when you sign in—such as entering a code sent to your phone or created by an authenticator app. This additional step makes a big difference in keeping your accounts secure. Even if someone manages to obtain your password, they still won't be able to access your account without completing the second verification.

Beware of imposters! Pegasus Bank will never initiate a call to you and ask you for the one-time code that was just sent to your device.

Password Managers

A password manager is a convenient tool that helps create, store, and automatically enter your passwords across websites and apps. It can flag weak or duplicated passwords and generate stronger, more secure ones for you. By securely saving your login details and filling them in when needed, it makes managing multiple accounts both safer and easier.
